Lab 7 – SELENIUM

Q1: Selenium is useful to test websites in the same way the user would interact with them.

Q2: Selenium only works with firefox and tests only client-side behavior; it can't directly test server database connections and such.

Q3: `<tr><td>myCase</td></tr>`

Q4: `<tr><td>click</td><td>//a[@id='myLink']/</td><td></td></tr>`

Q5: The benefit of HTML test cases is that they're already formatted for easy viewing; all you have to do is open them in any web browser. The downsides are that the test cases are harder to read when read as plain text.
